Take a Closer Look at Micro-Abrasive Blasting

Micro-abrasive blasting (MicroBlasting) works by propelling a uniform mixture of micron-sized abrasive particles and dry, compressed air out of a small nozzle at high velocity. It is a simple yet highly effective method to clean, cut, deburr or texture a wide variety of parts and surfaces.

Materials successfully processed using micro-abrasive blasting:

PEEK	Polypropylene
Titanium	Ceramic
Stainless Steel	Graphite
Copper	PTFE
Silicon	Kovar
Pyrolytic Carbon	Brass
Nitinol	Silicone
Inconel	Glass
Aluminum	

Comco's Applications Lab: Providing New Solutions for Medical Manufacturing

Comco's Applications Engineers have the expertise and complete test facilities to determine if a micro-abrasive blasting process can improve your production efficiency and product quality.

Micro-Abrasive Blasting for Medical Applications

Catheters & Guide Wires

Remove polymer and PTFE coatings from selected areas and prepare the wire surface to promote bond and coating adhesion.

Cannulae & Tubular Components

Deburr point and heel grinds, etch the surface prior to overmolding, and texture to enhance echogenic properties.

Stents, Plugs & Shunts

Remove laser induced remelt, dross, oxidation, and discoloration without altering the device geometry.

Implantable devices

Selectively deburr bone screws, plates and implantable prostheses and texture to promote tissue growth around the implant

Medical Molding

Surface texture on EDM or direct-machined mold cavities. Clean and restore the surface for maintenance purposes

Medical Electronics

Remove encapsulation material from pacemaker cans, expose conductors on defibrillator leads, and remove metallic layers on Piezo electrical transducers.

Integrating MicroBlasting with Automation

Comco also designs systems for applications requiring integration with semi-automated equipment.
